Category:Windows text editors Category:Microsoft Office-related software Category:2013 softwareA videoconferencing system may comprise a computer and an integrated camera, video monitor, microphone, and speaker that are connected to the computer by a network such as a local area network (LAN). The computer may act as a client to enable video communications.

The video display, microphone, and speaker are positioned at one of the sites in the videoconference to enable video communication with a plurality of other sites. As an example, the sites may be desktop computers or computers positioned at other locations. A videoconferencing system may comprise a network bridge that enables communication between the videoconferencing system and a traditional telephone network. Thus, telephone users may be able to participate in videoconferencing as if they were actually participating in a meeting at a location remote from the telephone.

Videoconferencing may be accomplished in a number of ways. For instance, a user may dial into a telecommunications network, which then may route the call to a videoconferencing system, or a user may directly dial into the videoconferencing system. In either case, the user may be able to participate in a videoconference with one or more remote participants. Video conferencing may be useful for businesses to increase productivity and to reduce communication costs, for example, by eliminating unnecessary travel costs. Thus, some businesses may provide videoconferencing facilities as a standard feature, or even a paid-for service. In a business environment, videoconferencing systems may include a videoconference server, which may provide for remote display, storage, and routing of video data streams that may be generated during a video conference. In some cases, the 82157476af
